

PROGRAM INFORMATION

Strand Authenticity Archive Video Data Authenticity

In today's world of litigation, it is mandatory that we have and maintain the means to verify the integrity of video data.

At Strand, we use a multi layered security process. We begin with a 128bit random number generation tool, along with a unique PGP Encryption Key and a check sum utility that verifies original data per frame.

Our Strand Stand Alone Viewer utilizes these tools to verify the data is original, first, best, and has not been tampered with or adjusted in any way on a frame by frame basis. The failure of any of these processes at time of playback, whether directly from the Strand Server or utilizing the Strand Stand Alone Viewer remotely, the clip will not be viewable.

Strand recognizes the stringent requirements for data integrity and stands behind the security of our software.

BENEFITS:

- ⇒ Multi-Layered
- ⇒ Unique PGP Encryption Key
- ⇒ Check Sum
- ⇒ Original Data Per Frame Verification
